Hash Functions and Chaos

Ambareesh Shyam Sundar

4 December 2023

What is a hash function?

What is a hash function?

• Converts input of arbitrary length into fixed-length output

What is a hash function?

- Converts input of arbitrary length into fixed-length output
- Frequently used in hash tables

Hash function: hash(key) = key % 17

key	hash(key)	value
5	5	"hello"
8	8	"goodbye"
36	2	"compression"
22	5	"collision"

• Deterministic (a == b and hash(a) == X imply hash(b) == X)

- Deterministic (a == b and hash(a) == X imply hash(b) == X)
- Non-invertible (given X == hash(a), it is difficult to determine the value of a)

- Deterministic (a == b and hash(a) == X imply hash(b) == X)
- Non-invertible (given X == hash(a), it is difficult to determine the value of a)
- Resistant to collisions (given hash(a) == X, it is difficult to find
 b != a such that hash(b) == X)

- Deterministic (a == b and hash(a) == X imply hash(b) == X)
- Non-invertible (given X == hash(a), it is difficult to determine the value of a)
- Resistant to collisions (given hash(a) == X, it is difficult to find
 b != a such that hash(b) == X)
- Avalanche effect (given a and a' are slightly different, even if hash(a) == X is known, it is hard to predict hash(a'))

Avalanche effect

Avalanche effect

Sensitive dependence on initial conditions

Avalanche effect

Sensitive dependence on initial conditions

Chaos?

Avalanche effect

Sensitive dependence on initial conditions

Chaos?

(transitivity helps)

The big question:

Can chaotic discrete maps be used as effective hash functions?

• Hash strings (char[]) to 32-bit unsigned integers (unsigned int)

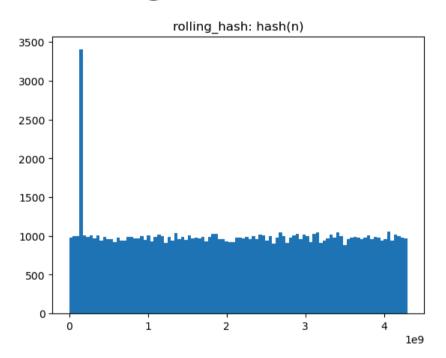

- Hash strings (char[]) to 32-bit unsigned integers (unsigned int)
- 4 different hashing algorithms
 - Rolling hash
 - Tent map
 - Dyadic map
 - "Multi-state" hash

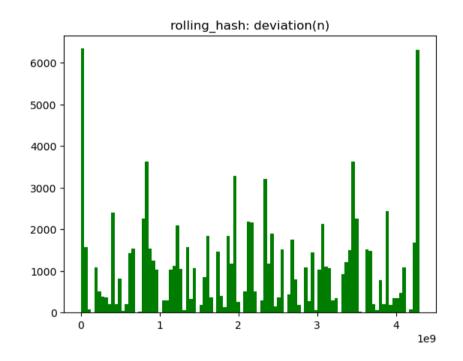

- Hash strings (char[]) to 32-bit unsigned integers (unsigned int)
- 4 different hashing algorithms
 - Rolling hash
 - Tent map
 - Dyadic map
 - "Multi-state" hash
- 3 different metrics
 - Distribution of hashed values
 - Number of collisions
 - Avalanche effect

Rolling hash

```
unsigned int rolling hash(char *n) {
    unsigned int hash = 0;
    unsigned int curr pow = 1;
    for (unsigned long i = 0; i < strlen(n); i++) {
        hash += n[i] * curr pow;
        curr pow *= 7919;
    return hash;
(Interpret the string as an integer in base 7919.)
```

Rolling hash

Collision percentage: 1.533%

Tent map hash

$$T(x) = \begin{cases} 2x & \text{if } x < \frac{2^{32} - 1}{2} \\ 2 \cdot ((2^{32} - 1) - x) & \text{otherwise} \end{cases}$$

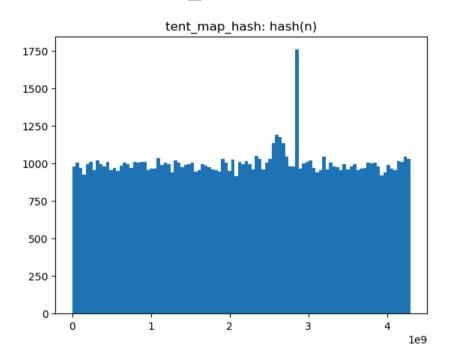

```
unsigned int tent_map_hash(char *n) {
   unsigned int hash = rolling_hash(n);
   int iterations = 53;
```

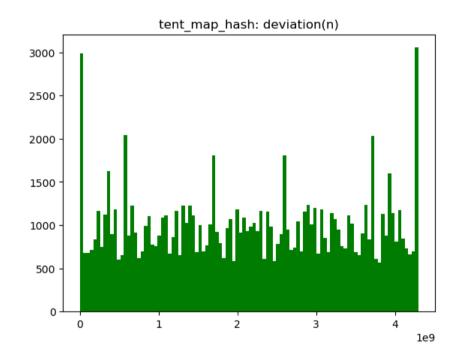

(Find the rolling hash value of the string.)

```
for (int i = iterations; i > 0; i--) {
    if (hash < UINT MAX / 2) {</pre>
        hash = 2 * hash;
    } else {
        hash = 2 * (UINT MAX - hash);
return hash;
```

(Perform 53 iterations of the tent map on the hash value.)

Tent map hash

Collision percentage: 1.536%

Dyadic map hash

$$D(x) = \begin{cases} 2x & \text{if } x < \frac{2^{32} - 1}{2} \\ 2 \cdot \left(x - \frac{2^{32} - 1}{2}\right) & \text{otherwise} \end{cases}$$

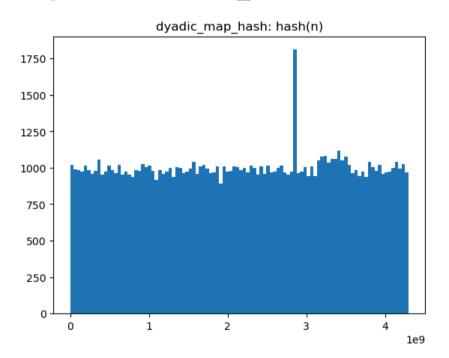

```
unsigned int dyadic_map_hash(char *n) {
   unsigned int hash = rolling_hash(n);
   int iterations = 53;
```

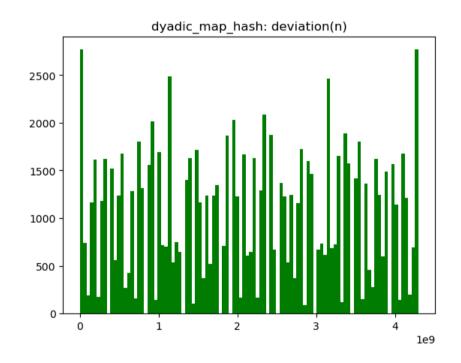

(Find the rolling hash value of the string.)

```
for (int i = iterations; i > 0; i--) {
    if (hash < UINT MAX / 2) {</pre>
        hash = 2 * hash;
    } else {
        hash = 2 * (hash - UINT MAX / 2);
return hash;
```

(Perform 53 iterations of the dyadic map on the hash value.)

Dyadic map hash

Collision percentage: 1.534%

• Suspiciously similar hashes between tent map and dyadic map

- Suspiciously similar hashes between tent map and dyadic map
- Only for certain strings

- Suspiciously similar hashes between tent map and dyadic map
- Only for certain strings

```
tent_map_hash with input "asdfqwer": 914563734
tent_map_hash with input "asdfqwgr": 1406886406
tent_map_hash with input "asdfqwer.": 4153872816

dyadic_map_hash with input "asdfqwer": 914564396
dyadic_map_hash with input "asdfqwgr": 1406886924
dyadic map hash with input "asdfqwer.": 141098142
```

• Topological conjugacy:

$$T(x) = C^{-1}(D(C(x)))$$

where

$$C(x) = \sin(\pi x)$$

• Topological conjugacy:

$$T(x) = C^{-1}(D(C(x)))$$

where

$$C(x) = \sin(\pi x)$$

• If $C(x) = \sin(\pi x) \approx x$, then $T(x) \approx D(x)$

• Rolling hash is weak

- Rolling hash is weak
- Easy to find collisions
 - Degrades performance due to lots of accidental collisions

- Rolling hash is weak
- Easy to find collisions
 - Degrades performance due to lots of accidental collisions
- Not chaotic, so small perturbations → small changes in hash
 - Transfers over to tent map and dyadic map hashes

- Rolling hash is weak
- Easy to find collisions
 - Degrades performance due to lots of accidental collisions
- Not chaotic, so small perturbations → small changes in hash
 - Transfers over to tent map and dyadic map hashes
- **Solution:** remove dependence on rolling hash

• Maintain four state variables: A, B, C, D (each 1/4 of the output)

- Maintain four state variables: A, B, C, D (each 1/4 of the output)
- Pad input in order to break it into chunks

- Maintain four state variables: A, B, C, D (each 1/4 of the output)
- Pad input in order to break it into chunks
- For each chunk:
 - Apply a (chaotic) map on (B, C, D) and store it in A
 - Rotate all values $(A \rightarrow B, B \rightarrow C, ...)$
 - After the chunk is processed, add the values of A, B, C, D to the global state

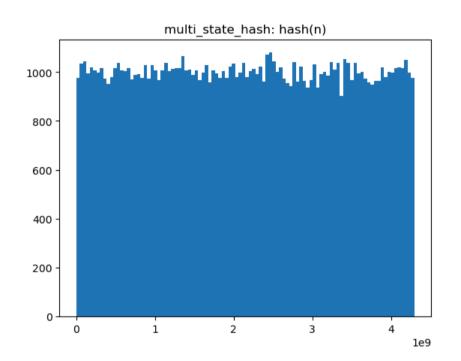

- Maintain four state variables: A, B, C, D (each 1/4 of the output)
- Pad input in order to break it into chunks
- For each chunk:
 - Apply a (chaotic) map on (B, C, D) and store it in A
 - Rotate all values $(A \rightarrow B, B \rightarrow C, ...)$
 - After the chunk is processed, add the values of A, B, C, D to the global state
- Return A concat B concat C concat D

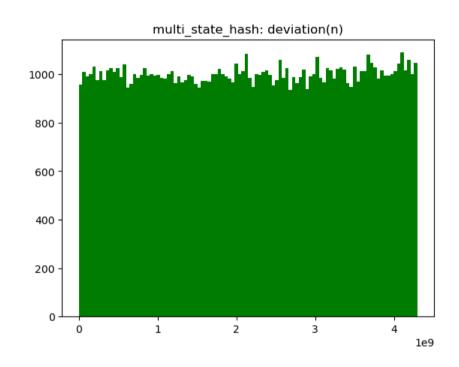

• Maintain four state variables: A, B, C, D (each an 8-bit integer)

- Maintain four state variables: A, B, C, D (each an 8-bit integer)
- Pad input to be a multiple of 32 * 4 = 128 bits

- Maintain four state variables: A, B, C, D (each an 8-bit integer)
- Pad input to be a multiple of 32 * 4 = 128 bits
- Add the next 8-bit chunk of input to A, apply the tent map to A, then rotate state values
 - Repeat 32 times per 8-bit chunk

- Maintain four state variables: A, B, C, D (each an 8-bit integer)
- Pad input to be a multiple of 32 * 4 = 128 bits
- Add the next 8-bit chunk of input to A, apply the tent map to A, then rotate state values
 - Repeat 32 times per 8-bit chunk
- Return A concat B concat C concat D

Collision percentage: 1.227%

Can a chaotic map be used to construct a simple and effective hash function?

Can a chaotic map be used to construct a simple and effective hash function?

Yes!

Can a chaotic map be used to construct a simple and effective hash function?

Yes! (mostly)

Can a chaotic map be used to construct a simple and effective hash function?

Yes! (mostly)

Things that worked:

- Determinism
- Hash distribution with multi-state hash
- Avalanche effect

Can a chaotic map be used to construct a simple and effective hash function?

Yes! (mostly)

Things that worked:

- Determinism
- Hash distribution with multi-state hash
- Avalanche effect

Things that didn't really work:

• Collision resistance

Potential future research:

- Why does the hash distribution of the rolling hash have such a significant peak?
- How can collision resistance for the multi-state hash be improved?

Thanks for listening!
